

## Advanced Services

Roy Williams  
California Institute of Technology

## Building Compute Services

- **Developer and Admin**
  - Services should be built by developers
  - In a framework managed by an administrator
- **Service developers must be careful**
  - Services can be dangerous (eg "execute any command")
- **Service users authenticated with "graduated security"**
  - Easy to start, but great power is possible
  - Or just keep it anonymous
- **Asynchrony for compute intensive jobs**
  - Jobs submitted to batch queue
  - Unique benchID may be used to monitor job & return results
- **From "clicking" to "scripting"**
  - Services may be accessed by clicking on a web page or with scripted client codes
  - Authentication for web clicking comes from a certificate in browser
  - Scripted access requires a certificate

## Persistent Storage ("workbench")

Ceramics class meets each week for 8 weeks

## Workbench

- **Persistent storage**
- **Just a directory in the web space**
  - Initiated by service
  - Tools operate on files in workbench
  - [`http://.....?bench=39840422&action=P&CA&\(other params\)`](http://.....?bench=39840422&action=P&CA&(other params))

```

## Workbench

- **URL to workbench is obscure**
  - `http://localhost/cgi-bin/vim?benchID=16213077368925688004920409437160`
  - Can send to your colleague
- **Set up as**
  - Read is free but URL is obscure
  - Using tools / write permission via password
- **Reaping**
  - Maybe 30-day lifetime for workbench storage?
    - Need cron process to delete old benches

## Keywords

- **“bench”**
  - If present, specifies workbench
- **“action”**
  - What should the server do?
    - Create workbench (provide password)
    - Upload data
    - Start algorithm
    - Monitor run (does the result exist?)
    - Download result
- **Others:**
  - Depends on action, specifies detail

## VIM server

```
if actionkey == "init":
    benchID = bench.makeBench()

elif form.has_key("bench"):
    benchID = form["bench"].value

else: print "No bench specified -- exiting"

# bench must be 32 decimal digits (NOT .././precious)
if re.match(r'^[0-9]{32,32}$', benchID, re.IGNORECASE) == None:
    print "Sorry, but %s does not look like a valid benchID name" % benchID
    sys.exit(1)

bench.setBenchID(benchID)

if actionkey == "urlltable": actions.urlltable(bench)
if actionkey == "deletetable": actions.deletetable(bench)
if actionkey == "fetch": actions.fetch(bench)
if actionkey == "addcol": actions.addcol(bench)
if actionkey == "select": actions.select(bench)
if actionkey == "join": actions.join(bench)
if actionkey == "sort": actions.sort(bench)
```

## Making things easier

- **Let them log in!**
  - Keeps record of workbenches
  - Who owns which
  - Users can ask for “my workbenches”
  - Can make log for funders
    - Who is doing what
- **BUT**
  - Users \*hate\* to register at websites

# Security and Certificates

- Stop attacks
- Access to secret data
- Access to big resources
- BUT
  - Lots of extra infrastructure
  - Users hate it

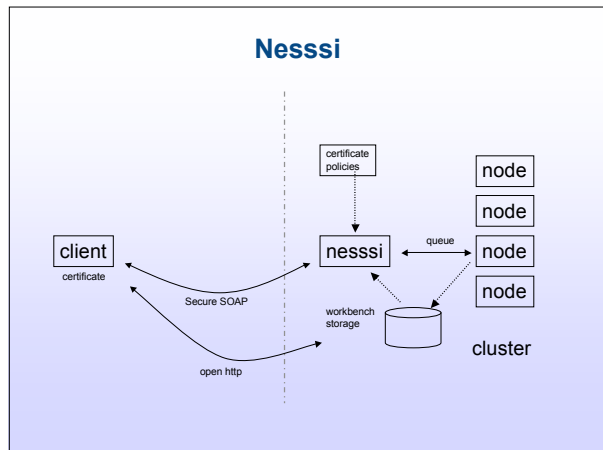

- Stop attacks

- Access to big resources
- BUT
  - Lots of extra infrastructure
  - Users hate it

## NESSI

### NVO Extensible Secure Scalable Service Infrastructure

- Services are science-oriented
- Services are made by trusted developers from the science community
- Web forms OR command line (Python API)
- Built-in security (X.509 certificates)
- Very large jobs can be run
- Easy to get a certificate
- No complex install needed by client
- Different levels of certificate get different service
- Is installed on Teragrid
- Services can be part of a workflow

- Services are science-oriented

- Web forms OR command line (Python API)
- Built-in security (X.509 certificates)
- Very large jobs can be run
- Easy to get a certificate
- No complex install needed by client
- Different levels of certificate get different service
- Is installed on Teragrid
- Services can be part of a workflow

[illegible]

An open-source  
webserver based  
on OpenSSL.

## A “Graduated Security” Model

## Traditional Grid Security

## Graduated Security

## Authentication with Certificates

- A digital certificate proves who you are
- X.509
  - Usually encrypted by passphrase
- Certificate as login
  - Map from certificate to account

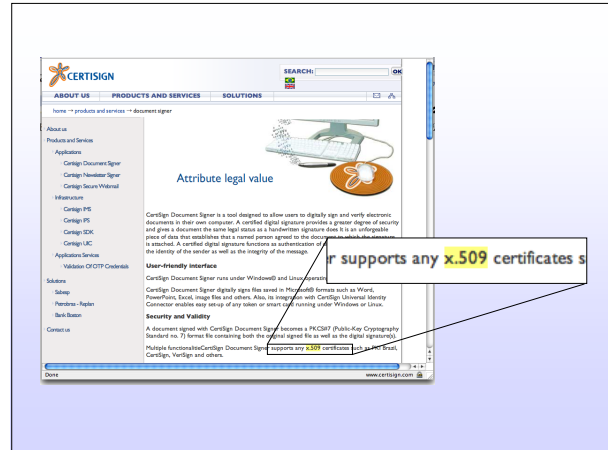

## Certificates

The Virtual Observatory as a Virtual Organization

This is a US driver's licence.  
In the US it proves identity strongly.  
It is like a **strong certificate**.

This is a loyalty card where I buy food.  
(You can put a false address on the application.)  
It is like a **weak certificate**.

## How to be a Certificate Authority

In order for an RA to validate the identity of a person, the subject should contact the RA **face-to-face** and **present photo-id** and/or valid official documents showing that the subject is an acceptable end entity as defined in the CP/CPS document of the CA.

In case of host or service certificate requests, the RA should **validate the identity** of the person in charge of the specific entities **using a secure method**. The RA should ensure that the requestor is appropriately authorized by the owner of the FQDN or the responsible administrator of the machine to use the FQDN identifiers asserted in the certificate.

## Bench ID

- Identify which job we are talking about
  - 32 character hex string eg  
cb28d0753a7fec9a485981f741d425ec
- Used to monitor a running job
 

```
sessionID = nesssiServer.cutout.init()
msg = server.cutout.monitor(sessionID)
```
- Used to form URL where results appear, eg
 

```
http://dtf-test1.sdsc.teragrid.org:8080
/ci/arens/shell/cb/cb28d0753a7fec9a485981f741d425ec/cutout
ts/index.html
```
- If you lose the sessionID, you lose your job

## Monitoring a Nesssi job

```
<NesssiMonitor>
<Service>Cutout</Service>
<Name>ux400560</Name>
<SessionID>774daF5eF2facc68cb03db4b1fde815</SessionID>
<Sandbox>http://dtf-test1.sdsc.teragrid.org:8080/
clarens/shell/77774daF5eF2facc68cb03db4b1fde815</Sandbox>
<Result>http://dtf-test1.sdsc.teragrid.org:8080/
clarens/shell/77774daF5eF2facc68cb03db4b1fde815/cutouts/index.html</Result>
<QueueStatus>149,envoy,cacr.caltech, batch, C8845cb, 11516, 1, --, --, 60:00 R, --
</QueueStatus>
</NesssiMonitor>
```

Annotations:

- service name: `Cutout`
- running as this user: `ux400560`
- session ID: `774daF5eF2facc68cb03db4b1fde815`
- sandbox URL: `http://dtf-test1.sdsc.teragrid.org:8080/clarens/shell/77774daF5eF2facc68cb03db4b1fde815`
- results URL: `http://dtf-test1.sdsc.teragrid.org:8080/clarens/shell/77774daF5eF2facc68cb03db4b1fde815/cutouts/index.html`
- queue status (R = running): `149,envoy,cacr.caltech, batch, C8845cb, 11516, 1, --, --, 60:00 R, --`

## Example: SleepyAdd

**Nesssi tester: SleepyAdd service**

This service acts as a test for the Nesssi system. There are three arguments: an integer number of seconds, and then two integers to add together. When the service starts, it sleeps for the given time, then adds the numbers and exits.

Sleep time in seconds:

First number:

Second number:

web portal

```
nesssiServer=nesssi.client('https://dtf-test1.sdsc.teragrid.org:8443/clarens/', debug=0)
sessionID = nesssiServer.sleepyadd.intrC()
print "Your session ID is", sessionID

# Run: sleep 30 seconds then add 52 and 344
nesssiServer.sleepyadd.run(sessionID, "-time 30 -n 52 -n 344")
```

command line

## Monitoring the Run

```
<NesssiMonitor>
<Service>Sleepyadd</Service>
<Name>ux400560</Name>
<SessionID>1a167a381110c0bd694132598659aa</SessionID>
<Result>http://dtf-test1.sdsc.teragrid.org:8080/clarens/shell/1a167a381110c0bd694132598659aa/batch_out</Result>
<Sandbox>http://dtf-test1.sdsc.teragrid.org:8080/clarens/shell/1a167a381110c0bd694132598659aa</Sandbox>
<QueueStatus>305875,dtf-ngnt1.sds ux400560 dque C3a1a167 -- 1 -- -- 18:00 Q --
</QueueStatus>
</NesssiMonitor>
```

**Key n is 52**  
**Key m is 344**  
**Key time is 30**  
**Sleeping for 30 seconds**  
**Waking up...**  
**Sum of 52 and 344 is 396**

## Mosaic Service

**DPOSS Mosaic service**

This service build custom mosaics from the DPOSS survey.

To use this service, you will need to specify a point in the sky, as right ascension (RA) and declination (Dec), and also the size in degrees of the requested coadded image.

RA:

Dec:

Image width in the RA direction in degrees:

Please enter the name of the bandpass (filter) to use. The choices are j (5000 Å), i (6500 Å), or n (7500 Å), which are calibrated to Gunn g, r, i, respectively. The default is f.

Bandpass:

And now just click on the button ....

```
nesssiServer=nesssi.client('https://envoy.cacr.caltech.edu:8443/clarens/', debug=0)

mosaic_loc = "-ra 49.1 -dec 60.1 -rawidth 0.5 -decwidth 0.5 -filt f -bgcorr 0"

session = nesssiServer.dpossMosaic.mosaic(mosaic_loc)
print "Your session ID is %s." % session

msg = dbsvr.dpossMosaic.monitor(session)
print msg
```

```
nessiServer.  
dpoMosaic.mosaic (  
    "-ra 49.1  
    -dec 60.1  
    -rawidth 0.5  
    -decwidth 0.5  
    -filt f  
    -bgcorr 0")
```

## Coadd Service

**Palomar-Quest coaddition service**

This Hyperatlas service computes resampled, mosaicked, and coadded images from the public release of the Palomar-Quest survey. You will need an NVO login (requires valid email address), from the data owner. To use this service, you will need to specify a point in the sky, as right ascension (RA) and declination (Dec), and also the pixel size of the requested coadded image.

RA:

Dec:

Image width in the RA direction:

Image height in the Dec direction:

Please enter the name of the bandpass (filter) to use. The choices are Johnson R, i or B (write [R], [i], or [B]), or Gunn r, i, z (write gr, gi, or zz)

Bandpass:

Finally specify the dates to use. The dates should be written as a python regular expression. The expression "\*" means all dates, the expression "2014" chooses each February 14th, and "20060131|20060201" chooses 2006 Jan 31 and 2006 Feb 1.

Dates:

And now just click on the button ...

```
nessiServer=nessi.client('https://envoy.cacr.caltech.edu:8443/clarens/', debug=0)  
  
# Initialize the service  
sessionID = nessiServer.hyperatlas.init()  
print "Session id is ", sessionID  
  
# Arguments for service, the coaddition to do  
args = "-bandpass z1 -ra 170.08 -dec 13.275 -rawidth 1.0 -decwidth 1.0"
```

```
-bandpass z1  
-ra 170.08 -dec 13.275  
-rawidth 1.0 -decwidth 1.0
```

## Cutout Service

**NVO Cutout service**

This service produces cutouts around given points from given surveys.

Browse for file containing points:

List of primary surveys:

List of other surveys:

Size of cutouts in pixels:

Max time in seconds to wait for SIAP:

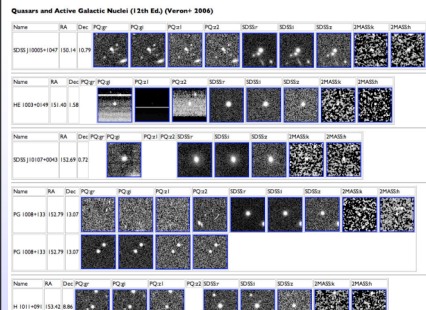

```
nessiServer=nessi.client('https://envoy.cacr.caltech.edu:8443/clarens/', debug=0)  
sessionID = nessiServer.cutout.init()  
print "Session id is ", sessionID  
  
# Upload locations file  
remoteInputfile = "/shell/22s/66/inputfile.xml" % (sessionID[0:2], sessionID)  
nessiServer.upload_file(inputfile, remoteInputfile)  
  
# Arguments for service, surveys to use and cutout size  
args = "-surveys PQ:gr,PQ:gi,PQ:z1,PQ:z2,SDSS:r,SDSS:i,SDSS:z,2MASS:k,2MASS:h "  
args += "-size 64"  
  
# Run service  
nessiServer.cutout.run(sessionID, args)
```

## Cutout Monitoring

**NVO Cutout Service**  
**Summary statistics for cutout service**  
**Total Locations in this run = 901**  
**Time for this run so far = 1219.0 seconds**

	SDSS-r	SDSS-i	SDSS-z
LocationsSofar			
Locations tried so far	42	42	42
AlreadyFound			
Number of cutouts already in output area			
SnapCandidates			
Number of candidates from SIAP lists	73	73	73
HitsSofar			
Number of hits from locations so far	67	67	66
SnapTime			
Time in making SIAP calls	8.6	8.5	8.5
DataTime			
Time to fetch remote images	366.7	381.7	348.2
ProcessingTime			
Time to process remote images	6.7	6.2	6.1
ImageAccessFail			
Cannot read remote image			
CutoutFail			
Zero or partial cutout	6	6	7
SnapCannotOpen			
Cannot connect to SIAP server			
XmlFail			
Cannot parse XML from SIAP call			
SnapNonConform			
Non-conforming VOTable from SIAP call			

Cutouts will appear below when the job is finished

cutouts from Palomar-Quest, SDSS, 2MASS  
of sources from Veron quasar catalog

## Amazon Grid (who will pay?)

- Simple Storage Service
- Write, read, and delete.
- Each object has a unique, developer-assigned key.
- Authentication mechanisms. Objects can be private or public. Rights can be granted to specific users.
- REST and SOAP interfaces
- Default download protocol is HTTP. BitTorrent(TM) also available.

### • Elastic Compute Cloud

- Create an Amazon Machine Image (AMI) containing your applications, libraries, data and associated configuration settings.
  - Upload the AMI into Amazon Simple Storage Service.
  - Configure security and network access.
  - Start, terminate, and monitor as many instances of your AMI as needed.
  - Pay for the instance hours and bandwidth that you actually consume.
- \$0.10 per instance-hour consumed
  - \$0.20 per GB of data transferred outside of Amazon
  - \$0.15 per GB-Month of Amazon S3 storage

### • Simple Queue Service

- Move data between distributed application components performing different tasks, without losing messages or requiring each component to be always available.
- Unlimited number of queues, unlimited number of messages.
- New messages can be added at any time.
- A computer can check a queue at any time for messages waiting to be read.
- REST, SOAP and query interfaces.
- The queue creator determines which other users can write to or read from the queue.

## AJAX (Asynchronous Javascript + XML)

- Uses browser's XML support: DOM, XSLT
- XMLHttpRequest
- Google Maps is best-known AJAX application

## What do GET/POST services lack?

- Format method for describing interface contract
- Reliable messaging
- Digital signatures
- Message routing
- Resource life cycle management
- Asynchronous event notification
- Other capabilities captured by WS-\* specs

## What is SOAP?

- Simple Object/Service-Oriented Access Protocol (Snakes On A Plane?)
- An XML-based communication protocol and encoding format for exchanging structured information in a decentralized, distributed environment
- W3C specification (<http://www.w3.org/TR/soap>)

## Anatomy of a SOAP message

- An envelope to encapsulate data which defines formatting conventions for describing the message contents and routing directions: header and body
- A message exchange pattern: request/response (RPC mechanism), fire-and-forget
- A transport or binding protocol
- Data encoding rules for describing the mapping of application-defined datatypes into an XML tag-based representation

## SOAP example

### Request:

```
<soap:Envelope xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Body>
    <ComovingLineOfSight xmlns="http://skyservice.pha.jhu.edu">
      <z>float</z>
      <hubble>float</hubble>
      <omega>float</omega>
      <lambda>float</lambda>
    </ComovingLineOfSight>
  </soap:Body>
</soap:Envelope>
```

### Response:

```
<soap:Envelope xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Body>
    <ComovingLineOfSightResponse xmlns="http://skyservice.pha.jhu.edu">
      <ComovingLineOfSightResult>float</ComovingLineOfSightResult>
    </ComovingLineOfSightResponse>
  </soap:Body>
</soap:Envelope>
```

## Client Invocation Models

- **Static: use generated stubs:**  
`java org.apache.axis.wsdl.WSDL2Java <wsdl url>`
- **Dynamic:**
  - no generated code
  - a proxy dynamically generates a class at runtime that conforms to a particular interface, proxying all invocations to a single 'generic' method
  - Examples:
    - Java : use `javax.xml.rpc.Service.getPort()` and `createCall()`
    - .NET : use `RealProxy` class (must extend `ContextBound`) or `Reflection.Emit`
- Generic SOAP client: <http://soapclient.com/soaptest.html>

## Why is SOAP better?

- Asynchrony
- Reliable messaging (e.g. once-and-only delivery, guaranteed or exact execution)
- Send and receive complex datatypes to invoke a particular method not just key-value pairs
- Security
- Binds to other protocols
- Service description

## Take a REST from SOAP?

- IVOA jumped into SOAP services in 2002
- But SOAP is perceived as "difficult"
  - WSDL (formal service description) is complex and not interoperable
- REST and GET are perceived as easier
- Where is the sophistication of SOAP really needed?

## Steering the VO ship

- **Short term Pragmatism**
  - useful tools now
  - simple protocols (eg cone search)
  - "just use RA and Dec"
- **Long term Architecture**
  - modular suite of interoperable tools
  - sophisticated protocols (eg skynode)
  - sophisticated Space-Time coordinates

VS

## Building Information Standards

Questions?
